Introduction

Principle

The present document provides estimated numbers of new cases and incidence rates for the whole of Switzerland. More than half of the Swiss cantons, 15 of 26, are covered by cancer registration. This represents 63% of the total population. However, the degree of coverage is very different between the two main cultural parts of the country: 47% for German-speaking cantons instead of 100% for French- and Italian-speaking cantons. Taking this into account, the statistical estimates are computed separately for each part and then added together.

Missing data for some of the registries

Due to lack of staff, the registry of Basle could not yet deliver the data for 2008. In order to insure the best Swiss estimates, a process was established to first compensate the missing cantonal data on a yearly basis. For each cancer site, gender and class of age, the rates of the missing year are extrapolated by linear regression over seven recent years with full registered data. The expected numbers of new cases are then computed from the estimated rates.

In the canton of Zurich, three hospitals withheld data due to data protection concerns which caused underregistration in the years 2007 and 2008. Part of the missing data could be retrieved via complementary sources. As the weight of that canton for the Swiss population amounts to 17%, it will cause some degree of bias in the Swiss estimates. A comparison of Swiss estimates based on expected counts showed that the suspected underregistration is below 5% for all cancer sites.

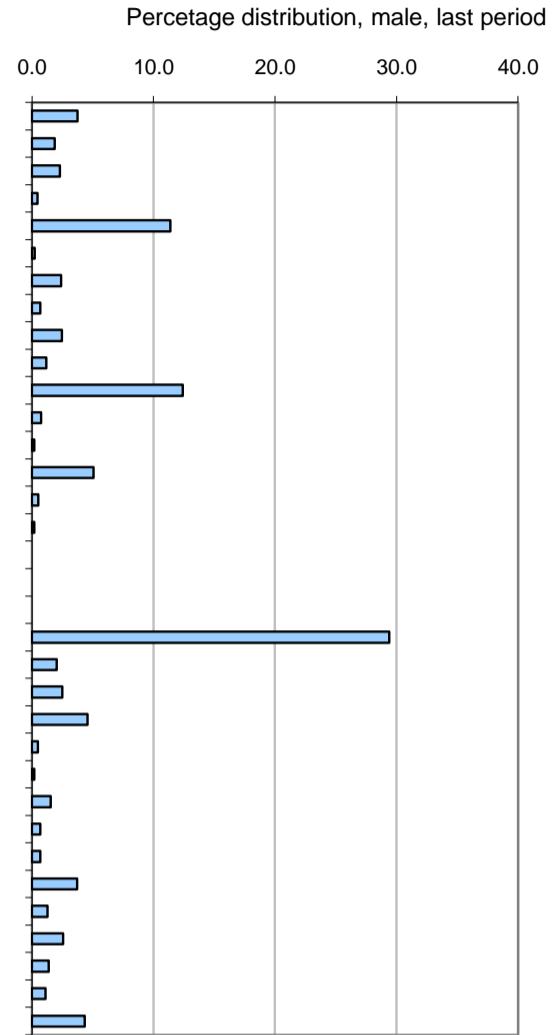

Number of new cases

ICD10	Male	Site	New cases by period					Total	Yearly average
